

Home Computers

For business or pleasure?

Every time you use your computer or other personal device, you access, create and store information.

Are your operating systems, browsers and antivirus software up-to-date? Is your home network secured? Do you have an efficient firewall? If not, you are at risk of becoming a victim of hacking, scams or identity theft.

Only you can be the link that protects your home computer, laptop and other personal devices.

Think Twice!

Protect your home computer, laptop and other personal devices against cyber-attacks and be careful! Anyone can become a target for cybercrime.

Be the strong link!

Install a firewall that will act as a barrier between your computer and the Internet and use an antivirus software to scan email attachments and files that you download.

Refrain from clicking links and buttons or opening attachments in any unsolicited email, tweet, post, or online advertisement.

Protect your home network as well as all your devices and accounts with distinct passwords made up of a combination of letters, numbers, and symbols such as %, @ or !.
